

July 3, 2026 Mindrift Hiring Team Tendem Project — AI Pilot (Bot Developer) Remote | Part-time Dear Mindrift Hiring Team, I am applying for the Freelance Chatbot Developer (AI Pilot) role on the Tendem project. I build messaging bots and integration backends in Python: webhooks, conversational state, LLM routing, fallbacks, and production hardening. I am based in Jamaica, work remotely, and I am genuinely excited about Mindrift's hybrid model where human specialists refine AI-generated bot code into experiences real users can trust. I did not apply with slides. I applied with a bot. **Tendem Demo Bot** is a Telegram bot I built specifically for this application. It is open source at github.com/zacharyahutton/telegram-bot-demo and demonstrates the exact patterns your posting describes: - **Multi-platform-ready architecture:** Telegram Bot API today, with webhook delivery, secret-token validation, and conversation patterns that map to WhatsApp Cloud API and Discord bots - **Conversational flows:** multi-step appointment booking, support ticket creation with priority, FAQ with 30+ curated answers across eight categories, and mode switching (menu / AI / FAQ / tools) - **LLM integration:** Groq and OpenAI via async Python, per-user conversation memory in SQLite, graceful degradation when the model fails, and FAQ keyword fallbacks so users never hit a dead end - **Backend integration mindset:** persistent state (users, bookings, tickets, analytics events), per-user rate limiting, admin /stats and /health commands, structured logging hooks - **Production deployment:** FastAPI webhook server deployed on Railway with health endpoint at [telegram-bot-demo-production-51ba.up.railway.app/health](https://51ba.up.railway.app/health), plus polling mode for local development This sits on top of work I have already shipped: **weROI (weroi.net)** — Production FastAPI backend with MongoDB, background jobs, Resend email automation, and GrowthIQ, an LLM-powered chat assistant with quick-reply routing, token limits, and local FAQ fallbacks before calling the model. **Webhook Relay API** — FastAPI sandbox for outbound webhooks with API-key auth, HMAC-SHA256 signing, exponential backoff retries, and per-key rate limiting. This is the same infrastructure thinking required when bots emit events to CRMs, payment systems, or internal queues. **Phone Store API** — MongoDB commerce API with signed order webhooks and async checkout flows. I am strongest in Python (FastAPI, Pydantic, async I/O), REST APIs, webhooks, and LLM conversational design. I read AI-generated code critically, refactor for edge cases, and ship integrations that fail loudly instead of silently. That is the AI Pilot workflow: collaborate with agents, own quality, deliver bots users can rely on. I am transparent: my deepest live bot is on Telegram. I have not yet shipped a production WhatsApp Business API deployment for a paying client, but I understand template approval flows, interactive messages, webhook verification, and platform rate limits, and I learn SDKs by building against real endpoints — which is what Tendem Demo Bot represents. **Why Mindrift and Tendem fit me:** - Part-time remote (10–20 hrs/week) matches how I already work on contract projects - Jamaica-based, fluent English, self-directed, detail-oriented - I want to grow in messaging + AI at the exact intersection your posting describes - Performance-based work rewards the quality bar I already hold on client delivery **Live demo:** t.me/zachtedem **Source:** github.com/zacharyahutton/telegram-bot-demo **Health check:** [telegram-bot-demo-production-51ba.up.railway.app/health](https://51ba.up.railway.app/health) **Portfolio:** zachary-hutton-portfolio.vercel.app **GitHub:** github.com/zacharyahutton I would welcome a 20-minute technical conversation or a small paid trial task. I can walk through the bot's conversation handlers, webhook server, and how I would extend the same patterns to WhatsApp and Discord on Tendem. Thank you for your consideration. Best regards, Zachary
